OLD DOMINION

STANDARD SPECIFICATION

Old Dominion pavers are manufactured to industry standard specifications ASTM: C 936, and CSA: A 231.2.

All Weight per Pallet noted above includes a 50 lb pallet weight.

*All metric dimensions are soft converted to Imperial. Dimensions and coverage include 1.5 mm (⅛") joint

SQUARES & RECTANGLES PURCHASE REQUIREMENT

All three (3) shapes are mixed on each layer and must be purchased by the full layer or full pallet.

SQUARES & RECTANGLES PALLET LAYOUT

Old Dominion Squares & Rectangles can be installed in a number of random or linear patterns. Experiment until you achieve the look that you desire. The diagram to the right shows the layout of each layer on the pallet.

With their pillow top surface and tapered corners, Mutual Materials® Old Dominion pavers offer a rustic appearance. Old Dominion Squares & Rectangles include three sizes, and can be installed in unique, random patterns. Old Dominion Circles make it easy to add a circular patio, fountain or other feature to your outdoor living space.

Use the three styles alone, or combine them for truly unique, interesting pavements using full circles, half circles, sweeping curves, fans and/or traditional cobblestone patterns.

Old Dominion pavers are ideal for residential, municipal and commercial applications.

</table>

* All metric dimensions are soft converted to Imperial. Dimensions and coverage include ¼” (3 mm) joint. Dimensions refer to completed circle.

** 262 ¾” = 21.86 ft, 367 ¾” = 30.6 ft

CIRCLE PURCHASE REQUIREMENT

Old Dominion Circle must be purchased by the full pallet (38.05 ft²).

CIRCLE INSTALLATION

One pallet of Old Dominion Circle will create a 6.96’ diameter circle, two pallets will create a 9.75’ diameter circle. If you would like to make an even bigger circle, use Old Dominion Squares & Rectangles for additional bands of the circle—be sure to mix the shapes together to keep joint spacing even. The pallet layout and installation patterns for Old Dominion Circle are below.

Important Considerations:

- The center is actually two-pieces which must be cut with a masonry blade along the score lines.
- You must include an ¼” (3 mm) joint between all pavers.
- Begin screeding sand and laying pavers from the center of the circle.

ROW PATTERNS

1. 2 cut CP (2 CP)
2. 8 SR (8 SR)
3. Alternate 1 R with 1 SR all the way around (8 R, 8 SR)
4. Start with 1 R and then install all LR (1 R, 23 LR)
5. 3 LR, 1 R, 2 LR, 1 R, repeat all the way around (23 LR, 9 R)
6. Start with 1 R, then alternate 1 LR with 1 R (20 LR, 21 R)
7. Start with 1 LR, then alternate 1 LR with 1 R (25 LR, 24 R)
8. Start with 1 LR, then alternate 1 LR with 1 R (29 LR, 28 R)
9. Start with 1 LR, then alternate 1 LR with 1 R (33 LR, 32 R)
10. Start with 1 R, then alternate 1 LR with 1 R (36 LR, 37 R)
11. Alternate 1 LR with 1 R (40 LR, 40 R)
INSTALLATION INSTRUCTIONS

For more specific and detailed instructions, please contact your Mutual Materials sales representative.

Materials Needed:

Necessary Tools for Paver Installation

- Shovel (flat and pointed)
- Rake
- Wheelbarrow
- Stakes (for setting grade)
- String lines & line level
- Hammer
- Push broom
- 8’ 2 x 4 (strike board)
- (2) Screed pipes (metal)
- Tape measure
- Trowel
- Garden hose w/spray nozzle
- Flat Head screwdriver

Rental Items

- Plate compactor
- Masonry saw w/diamond blade

Safety Gear

- Ear protection
- Safety glasses
- Dust mask (respirator)

Necessary Tools for Paver Installation

1. Excavation: Mark area to be paved with stakes and string lines at the desired finished elevation. Locate stakes outside the project area by a minimum of 4’. This will allow room for the edge restraint system. Excavate a minimum of 7” below final paver elevation. Allow ¼” to ½” per foot slope for correct water runoff. Slope can be in more than one direction depending on job site circumstances. Water will not penetrate joints unless it is allowed to puddle or remain in an area. Remove any loose soils after excavation is complete.

2. Base Preparation: Add a dusting of ¾” minus rock to the excavated area. This will allow the plate compactor to glide across area without sticking to the sub grade. Compact the entire subgrade with plate compactor. After compacting subgrade, add 1” – 2” of ¾” minus rock, rake smooth and compact. Base rock should have a certain amount of moisture content. Repeat steps until final base elevation is achieved. For a standard 2 ½” concrete paver, the final base elevation should be 3” below final paver elevation. Remember, the final product will mirror the base line with windows, doors, water features, etc. Pavers should be placed gently onto the sand bed and not pushed into it. Do not hammer set pavers. Setting a string line 3” above setting bed will allow the installer to maintain straight pattern lines. After installing a larger area, place plywood on top of pavers to walk around on. This will distribute weight so individual pavers will not get embedded into sand before adjustments and final compaction is done. Slight adjusting can be accomplished by moving pavers to desired spot by inserting a flat head screwdriver in between pavers and pushing them. Cut pavers can be used to fill any voids in the pattern along the edges. Mix pavers from multiple pallets to achieve a consistent color blend.

3. Bedding Sand: Bedding sand should be screeded at a depth between 1” – 1 ½”. Place 1” rigid pipe below elevation lines and measure down 2” to top of pipes. Place pipes parallel to each other and almost as wide as the strike board (2 x 4). Place sand in between pipes and pull strike board across both pipes. This will allow approximately 1” of sand screeded between the two pipes. Pull pipes out of sand; fill pipe voids with sand and trowel smooth. Do not compact sand bed.

4. Install pavers: Depending on the type of paver and pattern, starting points and direction of installation will vary. More times then not, opt for the easiest access with the longest run where no cutting will be made. Also consider more visible areas (i.e. in line with windows, doors, water features, etc). Pavers should be placed gently onto the sand bed and not pushed into it. Do not hammer set pavers. Setting a string line 3” above setting bed will allow the installer to maintain straight pattern lines. After installing a larger area, place plywood on top of pavers to walk around on. This will distribute weight so individual pavers will not get embedded into sand before adjustments and final compaction is done. Slight adjusting can be accomplished by moving pavers to desired spot by inserting a flat head screwdriver in between pavers and pushing them. Cut pavers can be used to fill any voids in the pattern along the edges. Mix pavers from multiple pallets to achieve a consistent color blend.

5. Edge Restraint: Any edge not retained by a solid, rigid structure (i.e. concrete, asphalt, etc) should be contained with a plastic edge restraint system. These are easier to install after the pavers are laid. Using a hose with a spray nozzle, carefully moisten sand bed around perimeter of paver area. This will allow a trowel to remove sand from paver edge without the sand migrating or sloughing away. Place edge restraint system against paver/bedding sand and on top of compacted base rock. Install 10” spikes every 8” – 12”. Make sure that all edges are contained before compaction of pavers.

6. Compaction: Before compaction, check to make sure all lines and patterns are at desired location. Sweep joint sand over entire area to fill paver joints and lock up pattern lines. Sweep excess joint sand off of paver surface. Place plate compactor on pavers and run compactor around perimeter. Then make back and forth runs, slightly overlapping the previous run. Sweep joint sand into joints again. Compact pavers in perpendicular runs to first compaction. When finished, sweep joint sand into paver joints until they are completely full.
